Lab 5 Questions

1. Test Driven Development is the process of creating tests for code to ensure its correctness before writing the code itself. This is to ensure that proper results for given input.
2. I agree that it improves confidence in your code because you know that it will work at each stage of development. I do not know if it increases overall quality. The reason I feel this way is because TDD limits what the developer can do at each stage, possibly making the code more inefficient because of earlier constraints on the code.
3. The advantage of TDD is that it guides the development of complicated code. The disadvantage is the increase in development time and code that must be written.
